

OpenAI Developers

Local shell mode uses the files you created above, without uploading or referencing a hosted skill.

Run this snippet from the directory containing `csv_insights_skill` in your execution environment.

This snippet only requests and displays commands. It does not execute them or complete the analysis. To complete the workflow, your application must review and execute `shell_call` commands in a sandbox, capture stdout, stderr, and the exit outcome, and return `shell_call_output` with the matching `call_id`. Continue until the model returns its final answer. See [Local shell mode](#) for the execution loop and output format.

```
import os
from pathlib import Path

from openai import OpenAI

if os.environ.get("RUN_SKILLS_API") == "1":
    client = OpenAI()
    skill_path = Path("csv_insights_skill").resolve()
    response = client.responses.create(
        model="gpt-6-astra",
        tools=[
            {
                "type": "shell",
                "environment": {
                    "type": "local",
                    "skills": [
                        {
                            "name": "csv-insights",
                            "description": (
                                "Summarize a CSV, compute basic stats,
                                and produce "
                                "a markdown report + a plot image."
                            ),
                            "path": str(skill_path),
                        }
                    ]
                },
            }
        ],
    )
